Top 5 Tips
MiniMed™ 780G pump with Guardian™ 4 sensor

1 Location, location, location.
Where you insert your sensor can make a big difference. In fact, it's best to choose a flat area on the back of your upper arm where you can "pinch an inch" that's also free of scar tissue.

2 Ask for a helping hand.
If you need extra support with sensor insertion on the back of your upper arm:
- Ask a buddy for help
- Stand in front of a mirror
- Refer to Medtronic online resources

3 Make it stick.
If additional tape isn't enough, consider using an optional skin adhesive. The key here is to use it after you insert the sensor but before you apply the first oval tape. We also recommend making sure that the sensor base and transmitter are covered with two pieces of tape. If additional tape is needed, you can add it on top.

4 Do not fear if “Sensor Updating” appears!
This is a safety feature that’s most likely to happen on the first day. There’s nothing you need to do unless your pump alerts you. Most of the time, it resolves on its own in an hour. But if it lasts for more than 3 hours, replace the sensor and get in touch with Medtronic for help.

5 Remember that the algorithm has your back.
All boluses (meals and corrections) are analyzed by the algorithm to assess for safety before being delivered. If you're experiencing highs after meals, consider bolus timing and talk to your healthcare team about your carb ratio.
Need a sensor replacement, tape kit, or additional training?

Consult with healthcare provider about treatment decisions.

Important safety information: MiniMed™ 780G system with SmartGuard™ technology with Guardian™ 4 sensor
The MiniMed™ 780G system is intended for continuous delivery of basal insulin at selectable rates, and the administration of insulin boluses at selectable amounts for the
management of type 1 diabetes mellitus in persons seven years of age and older requiring insulin as well as for the continuous monitoring and trending of glucose levels in
the fluid under the skin. The MiniMed™ 780G System includes SmartGuard™ technology, which can be programmed to automatically adjust insulin delivery based on the
continuous glucose monitoring (CGM) sensor glucose values and can suspend delivery of insulin when the SG value falls below or is predicted to fall below predefined
threshold values.
The Medtronic MiniMed™ 780G System consists of the following devices: MiniMed™ 780G Insulin Pump, the Guardian™ 4 Transmitter, the Guardian™ 4 Sensor,
One-press serter, the Accu-Chek™ Guide Link blood glucose meter, and the Accu-Chek™Guide Test Strips. The system requires a prescription from a healthcare
professional.
The Guardian™ 4 Sensor is intended for use with the MiniMed™ 780G system and the Guardian 4 transmitter to monitor glucose levels for the management of diabetes.
The sensor is intended for single use and requires a prescription. The Guardian™ (4) sensor is indicated for up to seven days of continuous use.
The Guardian™ 4 sensor is not intended to be used directly to make therapy adjustments while the MiniMed™ 780G is operating in manual mode. All therapy adjustments
in manual mode should be based on measurements obtained using a blood glucose meter and not on values provided by the Guardian™ 4 sensor. The Guardian™ 4
sensor has been studied and is approved for use in patients ages 7 years and older and in the arm insertion site only. Do not use the Guardian™ 4 sensor in the abdomen
or other body sites including the buttocks, due to unknown or different performance that could result in hypoglycemia or hyperglycemia.

WARNING: Do not use the SmartGuard™ feature for people who require less than 8 units or more than 250 units of total daily insulin per day. A total daily dose of at
least 8 units, but no more than 250 units, is required to operate in the SmartGuard™ feature.

WARNING: Do not use the MiniMed™ 780G system until appropriate training has been received from a healthcare professional. Training is essential to ensure the safe
use of the MiniMed™ 780G system.

WARNING: Do not use SG values to make treatment decisions, including delivering a bolus, while the pump is in Manual Mode. When the SmartGuard™ feature is active
and you are no longer in Manual Mode, the pump uses an SG value, when available, to calculate a bolus amount. However, if your symptoms do not match the SG value,
use a BG meter to confirm the SG value. Failure to confirm glucose levels when your symptoms do not match the SG value can result in the infusion of too much or too
little insulin, which may cause hypoglycemia or hyperglycemia.
Pump therapy is not recommended for people whose vision or hearing does not allow for the recognition of pump signals, alerts, or alarms. The safety of the MiniMed™
780G system has not been studied in pregnant women, persons with type 2 diabetes, or in persons using other anti-hyperglycemic therapies that do not include insulin. For
complete details of the system, including product and important safety information such as indications, contraindications, warnings and precautions associated with system
and its components, please consult https://www.medtronicdiabetes.com/important-safety-information#minimed-780g and the appropriate user guide at
